

Bluestock Mutual Fund Analytics Platform

Final PDF Report

End-to-end data engineering, ETL, exploratory analytics, fund performance analysis, and dashboard reporting.

Prepared for	Project review and submission
Prepared on	June 21, 2026
Scope	Mutual fund analytics capstone
Reference inputs	Capstone brief PDF, dashboard PDF, previous final report PDF, processed CSVs, charts, and dashboard screenshots

Design note: all report text, tables, headings, page rules, and captions are rendered in black. Color appears only inside the original analytical charts and dashboard screenshots.

Report structure

- The structure follows the reference capstone PDF: objective, problem statement, datasets, ETL architecture, EDA, performance analytics, dashboard evidence, limitations, and final recommendations.
- Executive summary introduces the headline metrics and business meaning.
- Data sources and ETL pages explain how raw files become a validated analytical model.
- EDA and performance pages translate the processed data into market, investor, and fund insights.
- Dashboard pages show the final reporting layer used for stakeholder review.
- Limitations and recommendations close with practical next steps for production readiness.

Submission coverage

- The PDF is designed as the final reader-facing report for evaluation.
- Each analytical section includes either a table, a chart, or dashboard evidence.
- Methodology details are summarized in the report body, while raw scripts and notebooks remain available in the project folder.

Table Of Contents

Section	Page
Reference Inputs And Capstone Alignment	3
Executive Summary	4
Data Sources	5
Data Quality And Readiness	6
ETL Design	7
EDA Findings - Market And Industry Trends	8
EDA Findings - Market Visuals	9
EDA Findings - Investor Behavior	10
EDA Findings - Category, Portfolio, And Correlation	11
Performance Analysis - Scorecard Framework	12
Performance Analysis - Risk And Return Visuals	13
Performance Analysis - Downside Risk	14
Performance Analysis - Benchmarking	15
Dashboard Screenshots	16-19
Limitations, Recommendations, And Closing	20

List of figures

- Figures 1-9 are analytics charts generated from the Bluestock processed data and report metrics.
- Figures 10-13 are dashboard screenshots from the Bluestock dashboard reference output.
- The reference capstone PDF screenshot on page 3 documents the source layout and requirement basis.

Reader path

- Pages 3-7 explain the reference basis, data sources, data quality, and ETL method.
- Pages 8-15 present evidence from EDA and performance analytics.
- Pages 16-19 show the dashboard screenshots used for stakeholder presentation.
- Page 20 closes with limitations and implementation recommendations.

All report text, headings, tables, captions, and rules are black. Chart and dashboard colors are kept only inside the referenced images so the evidence remains readable.

Reference Inputs And Capstone Alignment

This Bluestock final PDF was rebuilt using the provided Bluestock reference materials. The capstone brief defines the project scope and required analytical work; the dashboard PDF and page screenshots define the final reporting layer; the processed CSVs, charts, and scorecard files provide the evidence used in the findings.

Reference material	How it was used in this final PDF
Bluestock_MF_Capstone_Project.pdf	Used as the requirement blueprint for project objective, problem statements, dataset coverage, ETL architecture, task breakdown, technical stack, deliverables, and evaluation expectations.
bluestock_mf_dashboard.pdf	Used as the visual reference for the four dashboard sections: Executive Overview, Fund Performance, Investor Analytics, and SIP & Market Trends.
Final_Report.pdf	Used as an analytical reference for existing report structure, chart evidence, and narrative coverage.
Processed CSVs and report metric files	Used to compute the executive metric table, source coverage, scorecard ranking, risk table, alpha/beta table, and recommendation evidence.

BLUESTOCK		FINTECH	
Capstone Project			
Mutual Fund Analytics Platform			
End-to-End Data Engineering, ETL Pipeline & Interactive Dashboard			
Company	Bluestock Fintech Pvt. Ltd.		
Domain	Mutual Fund / Fintech		
Project Type	Individual Capstone (1 Week)		
Duration	7 Working Days (1 - 50-55 Hours)		
Data Source	AMFI India (Public), Infosys, NSE/BSE Public Data		
Technologies	Python, SQL, Power BI / Tableau, Pandas, Matplotlib		
Submission	PDF Report + Dashboard + GitHub Repository		
Prepared By	Intern / Data Analyst — Bluestock Fintech		
Date	June 2025		
40 Schemes	10 Datasets	87K+ Rows	4.5 Yrs
Real Fund Schemes	Provided	Transaction Data	NRI History
All data in this project is sourced from publicly available information published by AMFI India, NSE, BSE and open API's (if any). This project is for educational purposes only and does not constitute financial advice. Mutual Fund investments are subject to market risks.			

Reference evidence: capstone brief cover page showing Bluestock Mutual Fund Analytics Platform scope.

Requirement mapping

- Data sources are documented as the 10 provided datasets named in the capstone brief.
- ETL design follows the layered workflow described in the reference PDF and implemented in the project scripts.
- EDA findings cover market, investor, category, portfolio, and correlation analysis.
- Performance analysis covers scorecard, risk-return, downside risk, benchmark, alpha, beta, and tracking-error evidence.
- Dashboard screenshots are included as final visual proof, with captions and interpretation bullets.

How this page should be read

- The reference PDF defines the required academic/project structure.
- The generated report translates that structure into a cleaner final PDF with consistent fonts and page layout.
- The analytical claims are backed by the Bluestock processed data, not by the reference layout alone.

Executive Summary

The Bluestock Mutual Fund Analytics Platform converts a 10-dataset mutual fund project bundle into a reusable analytics workflow. The solution profiles raw data, cleans and validates it, loads a SQLite-style analytical model, computes risk-adjusted performance measures, and presents decision-ready insights through charts, scorecards, and dashboard screenshots.

Metric	Value	Interpretation
Schemes tracked	40	Cross-section for fund comparison and risk scorecarding.
Processed NAV rows	64,320	Calendar-filled NAV history after ETL expansion.
Transactions	32,778	Investor behavior sample used for demographics and transaction analysis.
Investors	5,000	Distinct investor IDs represented in the transaction layer.
Total transaction amount	352.16 Cr	Aggregate transaction value across the sample.
SIP inflow growth	169.2%	Monthly SIP inflow rose from 11,517 Cr in Jan 2022 to 31,002 Cr in Dec 2025.
Folio growth	97.0%	Total folios increased from 13.26 Cr to 26.12 Cr.

The core business story is positive market participation and differentiated fund outcomes: SIP inflows rose strongly, folios nearly doubled, and the top scorecard funds combine attractive 3-year CAGR, Sharpe ratio, drawdown control, and manageable expense profiles.

Executive action points

- Use the scorecard to shortlist funds, then validate mandate fit and investor risk appetite.
- Treat SIP and folio growth as market-expansion signals, not as standalone fund-selection proof.
- Use dashboard pages for discussion, but use source CSVs and metric tables for audit or reruns.

What changed from raw project outputs

- Raw CSVs were converted into cleaned processed tables and reusable charts.
- Scorecard metrics were summarized into decision-ready ranking views.
- Dashboard screenshots were added with interpretation so the PDF works without Power BI interactivity.

Decision-useful interpretation

- The platform is ready for project review because the main evidence chain is complete: source data, cleaned model, metrics, visuals, and dashboard output.
- The strongest business signal is recurring participation growth, shown through SIP inflow and folio expansion.
- The strongest fund-selection signal is the scorecard, because it combines return, risk, and downside behavior.

Data Sources

The project uses public or project-provided mutual fund datasets. The files cover the market, schemes, investors, performance, portfolios, and benchmarks needed to build an analytical layer.

Source file	Analytical role	Coverage
01_fund_master.csv	Fund and scheme master	40 schemes
02_nav_history.csv	Historical NAV by scheme	46,000 source rows; 64,320 processed calendar rows
03_aum_by_fund_house.csv	AMC AUM trend	90 rows
04_monthly_sip_inflows.csv	Monthly SIP flows	48 rows
05_category_inflows.csv	Category-level inflows	144 rows
06_industry_folio_count.csv	Industry folio trend	21 rows
07_scheme_performance.csv	Reported fund performance	40 rows
08_investor_transactions.csv	Investor transaction sample	32,778 rows
09_portfolio_holdings.csv	Holdings and sector exposure	322 rows
10_benchmark_indices.csv	NIFTY50 and NIFTY100 series	8,050 rows

Source-to-model mapping

- Fund master becomes the scheme dimension used across NAV, performance, transactions, and holdings.
- NAV and benchmark files support return, volatility, drawdown, Sharpe, alpha, beta, and tracking analysis.
- Investor transactions support geography, age, city-tier, amount, and transaction-type segmentation.
- AUM, SIP, category inflow, and folio files provide market context beyond individual scheme returns.

Why these sources matter

- The source set covers both fund performance and investor behavior, so the report can discuss returns and adoption together.
- Benchmark data makes the performance section stronger because funds can be compared against market indices.
- Portfolio holdings add exposure context that pure NAV analysis cannot explain.

Data governance note

- Keep raw files unchanged so the project can be re-audited from the original inputs.
- Store processed files separately so cleaning choices are visible and reproducible.
- Use consistent scheme identifiers across every table before calculating fund-level metrics.

Data Quality And Readiness

Data quality work focused on schema consistency, key integrity, positivity checks, date handling, and reconciliation between processed files and modeled tables.

Quality check	Result	Meaning
AMFI code coverage	40 of 40 schemes present in NAV history	No scheme master orphan records in the core NAV layer.
NAV values	Positive after cleaning	Prevents invalid return calculations.
Transaction amounts	Positive after cleaning	Investor transaction facts are analytically usable.
Performance anomalies	0 rows flagged	No outlier rows blocked the performance scorecard.
SQLite row audit	All processed row counts matched	The modeled tables reconcile to processed CSV outputs.

The NAV layer intentionally expands trading-day data to calendar-day data. Weekend and holiday rows are forward-filled so downstream rolling returns, volatility, and dashboard trend views operate on a continuous date axis.

Validation steps followed

- Checked scheme keys before analytics so fund-level joins do not create orphan or duplicate records.
- Validated positive NAV and transaction amount fields before computing returns or investor totals.
- Reconciled processed CSV row counts with SQLite table counts to confirm load completeness.
- Flagged first-year SIP YoY growth as expected null history rather than a data-quality defect.

Readiness conclusion

- The cleaned dataset is suitable for project-level analytics, dashboarding, and fund comparison.
- The validation approach reduces the risk of misleading scorecard outputs caused by broken joins or invalid numeric values.
- For production, the same checks should run automatically before any dashboard refresh.

Quality controls to retain

- Run row-count reconciliation after every ETL refresh.
- Log rejected or corrected records so future reviewers can understand data changes.
- Check benchmark coverage before recomputing alpha, beta, and tracking error.

ETL Design

The ETL design separates reproducibility from presentation. One pipeline runner coordinates ingestion, cleaning, loading, metric computation, chart generation, notebooks, and final reporting.

Layer	Action	Output
Extract	Read raw CSVs and profile columns, data types, nulls, and row counts.	Source inventory and ingestion profile.
Transform	Standardize dates, cast numeric fields, forward-fill NAV, validate positive values, and build dimensions.	Clean processed CSVs.
Load	Organize facts and dimensions into a SQLite star schema.	Fund, date, NAV, AUM, SIP, transaction, performance, benchmark, and holding tables.
Analyze	Compute CAGR, Sharpe, Sortino, alpha, beta, drawdown, VaR, CVaR, tracking error, HHI, and fund score.	Metric tables and scorecards.
Publish	Generate charts, dashboard screenshots, PowerPoint evidence, and final PDF report.	Reusable review artifacts.

The star schema gives reviewers a stable foundation for slicing by scheme, date, fund house, category, investor segment, transaction type, benchmark, and sector exposure.

Operational workflow

- Run ingestion first to create row-count and schema checks for all raw inputs.
- Run cleaning and ETL next so every analytical table has standard dates, keys, and numeric types.
- Run metric computation after load because scorecard metrics depend on clean NAV, benchmark, and scheme metadata.
- Generate reports and dashboards last so every visual is tied to a reproducible processed output.

ETL deliverables produced

- Processed CSV files for analysis and Power BI import.
- SQLite schema and query files for structured review.
- Charts and scorecards for final-report evidence.
- Dashboard screenshots and presentation assets for stakeholder communication.

Pipeline improvement opportunities

- Add automated exception reports for missing dates, duplicate scheme IDs, and invalid amounts.
- Version each output folder by run date so old and new dashboard results can be compared.
- Add a run summary table that records input rows, output rows, and validation status.

EDA Findings - Market And Industry Trends

The market-level view shows growth across AUM, folios, and SIP participation. Latest AUM remains concentrated in the largest AMCs, while SIP activity and folio count indicate broad retail participation.

Fund house	Latest AUM lakh Cr	Schemes
SBI Mutual Fund	12.50	186
ICICI Prudential MF	10.74	216
HDFC Mutual Fund	9.30	195
Nippon India MF	7.00	177
Kotak Mahindra MF	5.80	168

- SBI Mutual Fund leads the latest AUM view at 12.50 lakh crore.
- Monthly SIP inflow reached 31,002 Cr by Dec 2025, up from 11,517 Cr in Jan 2022.
- Total folios increased from 13.26 Cr to 26.12 Cr, showing a larger investor base.
- Category inflows show debt and liquid categories as large allocation channels, with equity categories providing differentiated risk-return opportunities.

EDA reading steps

- Start with market size indicators: AUM, folios, SIP inflow, and active SIP accounts.
- Then compare fund-house concentration to understand where market scale is concentrated.
- Finally use category and scheme-level metrics to separate broad industry growth from fund-specific quality.

Business interpretation

- AUM concentration helps identify market leaders, but it does not automatically mean better fund performance.
- SIP and folio growth indicate investor participation depth, which is useful for market-size discussion.
- Category inflow patterns help explain whether investors prefer growth, income, or liquidity-oriented products.

Market analysis conclusion

- Industry growth should be used as context before reviewing individual funds.
- Fund-house AUM ranking is most useful for scale discussion, not direct return comparison.
- The strongest market signal in this report is the combined rise in SIP inflow and total folios.

EDA Findings - Market Visuals

AMC AUM dominance at latest year-end

AUM in lakh crore INR; SBI remains the largest AMC in the sample.

Figure 1. AUM growth by fund house.

Monthly SIP inflows reached a new high

SIP inflow in crore INR, Jan 2022-Dec 2025.

Figure 2. Monthly SIP inflow trend.

Key visual takeaways

- AUM growth identifies the scale leaders that anchor the industry view.
- The SIP trend shows steady monthly expansion and supports the investor participation narrative.
- These visuals should be read with folio growth to avoid relying only on asset-size concentration.

Related observations

- The AUM chart gives a cross-sectional ranking of major fund houses at the latest date.
- The SIP line chart gives a time-series view of monthly participation momentum.
- Together, the charts connect institutional scale and recurring retail investment behavior.

EDA Findings - Investor Behavior

Investor analytics highlights transaction mix, geography, age behavior, city tier split, and contribution by state. In the sample, SIP transactions account for the majority of activity, while T30 cities contribute about two-thirds of transaction records.

Investor metric	Value
Distinct investors	5,000
Transactions	32,778
Average transaction amount	107437 INR
SIP share of transactions	60.2%
T30 city-tier share	66.3%

SIP amount by state

Total SIP amount in INR across transaction sample.

Figure 3. SIP amount by state.

Investor analysis steps

- Segment transactions by state and city tier to identify regional contribution patterns.
- Compare SIP, lumpsum, and redemption mix to understand whether flows are recurring or one-time.
- Use age group and average amount views to size which cohorts may need tailored communication.

Investor insight

- State-level SIP concentration can guide regional engagement campaigns.
- City-tier mix helps separate metro-heavy behavior from wider market penetration.
- Transaction-type analysis helps distinguish regular investment habits from one-time purchase or redemption activity.

EDA Findings - Category, Portfolio, And Correlation

The cross-sectional views connect fund behavior with allocation themes. Category inflow heatmaps expose fund-flow concentration, sector allocation shows portfolio exposure, and NAV/return correlation supports diversification review.

Figure 4. Category inflow heatmap.

Figure 5. Aggregate sector allocation.

How to use these views

- Use category flow patterns to see whether market money is moving defensively or toward growth assets.
- Use sector allocation to understand portfolio exposure before recommending any concentrated fund.
- Use correlation analysis to avoid pairing funds that look different by name but behave similarly in returns.

Portfolio interpretation

- Sector allocation explains why two funds with similar returns may still carry different exposure risk.
- Category inflow heatmaps are useful for spotting periods of unusually high investor preference.
- Correlation review supports diversification decisions by identifying funds that move together.

Performance Analysis - Scorecard Framework

The scorecard ranks schemes using return, risk-adjusted performance, alpha, expense efficiency, and drawdown control. This prevents the recommendation layer from over-weighting raw returns alone.

Rank	Scheme	Score	Sharpe	3Y CAGR	Max drawdown
1	Mirae Asset Large Cap Fund - Regular - Growth	86.25	1.07	22.4%	-11.3%
2	ICICI Pru Midcap Fund - Regular - Growth	82.88	0.88	21.0%	-18.2%
3	Kotak Flexicap Fund - Regular - Growth	82.00	0.97	19.6%	-13.0%
4	HDFC Mid-Cap Opportunities Fund - Regular - Growth	80.75	0.81	21.4%	-16.2%
5	ICICI Pru Bluechip Fund - Direct - Growth	79.38	0.71	21.4%	-12.6%

Mirae Asset Large Cap Fund - Regular - Growth leads the computed scorecard with a score of 86.25, supported by the highest Sharpe ratio in the scoring table and a strong 3-year CAGR.

Scorecard interpretation steps

- Screen for high fund score first to identify balanced candidates.
- Check Sharpe and 3-year CAGR together so high return is not separated from risk efficiency.
- Review max drawdown before recommendation because downside behavior can change investor suitability.
- Use expense ratio and alpha as tie-breakers where funds show similar return and risk profiles.

Recommendation guardrail

- A high score should create a shortlist, not a final recommendation by itself.
- The final selection should still consider investor horizon, category mandate, liquidity need, and tolerance for drawdown.
- Funds with similar scores should be compared using risk-adjusted metrics and benchmark behavior.

Performance Analysis - Risk And Return Visuals

Risk-return scatter

3Y return vs annualized standard deviation; bubble size is AUM.

Figure 6. Fund risk-return scatter.

Top funds by computed Sharpe

Sharpe uses 6.5% annual risk-free-rate proxy.

Figure 7. Top funds by computed Sharpe ratio.

Risk-return reading guide

- Funds in the upper-left area are preferable because they combine higher return with lower volatility.
- Sharpe rankings help compare funds across categories, but category mandate should still be checked.
- Outlier low-risk funds may have stable returns but lower upside; they are not always the best growth choice.

Analytical use

- Risk-return scatter is best for narrowing the field before reading detailed fund tables.
- Sharpe ranking is useful for comparing efficiency, but it should be read with volatility and drawdown.
- The combination of scatter and Sharpe charts helps explain both position and rank.

Performance Analysis - Downside Risk

VaR and CVaR identify funds with the highest one-day tail risk in the sample. Small-cap funds dominate the most negative VaR list, consistent with their higher volatility and risk category.

Scheme	VaR 95	CVaR 95	Risk category
ABSL Small Cap Fund - Regular - Growth	-2.4%	-3.0%	Very High
Axis Small Cap Fund - Regular - Growth	-2.3%	-3.0%	Very High
SBI Small Cap Fund - Direct Plan - Growth	-2.3%	-3.0%	Very High
Nippon India Small Cap Fund - Regular - Growth	-2.3%	-3.0%	Very High
DSP Small Cap Fund - Regular - Growth	-2.2%	-2.9%	Very High

Highest historical 95% VaR

Absolute daily VaR magnitude; higher means deeper downside threshold.

Figure 8. Historical 95% VaR by fund.

Downside-risk usage

- Use VaR as a quick estimate of adverse daily movement under normal market stress.
- Use CVaR to understand average loss beyond the VaR cutoff for tail-risk discussion.
- Pair VaR and drawdown before classifying a fund as suitable for conservative investors.

Risk-control interpretation

- Small differences in return can be outweighed by large differences in downside loss.
- Funds with high VaR may still be appropriate for aggressive investors, but they need clear suitability labeling.
- CVaR should be monitored for funds where the worst cases are materially worse than normal volatility suggests.

Performance Analysis - Benchmarking

Benchmark comparison evaluates whether scheme returns are differentiated after considering market reference indices. Alpha and beta outputs support discussion of excess return and sensitivity to benchmark movement.

Scheme	Benchmark	Alpha	Beta
SBI Small Cap Fund - Regular Plan - Growth	NIFTY100	30.3%	-0.02
DSP Small Cap Fund - Regular - Growth	NIFTY100	30.1%	0.01
ICICI Pru Midcap Fund - Regular - Growth	NIFTY100	29.3%	0.00
Mirae Asset Tax Saver Fund - Regular - Growth	NIFTY100	28.3%	0.02
Kotak Flexicap Fund - Regular - Growth	NIFTY100	27.3%	-0.02

Figure 9. Top schemes versus NIFTY50 and NIFTY100 indexed benchmarks.

Benchmark review steps

- Compare indexed growth lines to see whether outperformance is persistent or short-window driven.
- Use alpha to evaluate excess return, then use beta to understand market sensitivity.
- Review tracking error when a fund claims benchmark-like behavior but visually diverges from the index.

Benchmark interpretation

- Alpha identifies whether a fund added return beyond the selected benchmark.
- Beta explains how sensitive the fund is to benchmark movement.
- Tracking error helps separate active-management behavior from index-like behavior.

Dashboard Screenshots - Executive Overview

The executive dashboard page consolidates AUM, folios, SIP inflow, schemes tracked, folio growth, SIP trend, and latest AUM by fund house for management review.

Figure 10. Dashboard page 1 - Executive Overview.

Dashboard review points

- Use this page first in stakeholder meetings because it summarizes scale, growth, and market health.
- Check KPI cards before drilling into fund-specific pages.
- Use the AUM and SIP charts together to separate institutional scale from retail participation momentum.

Presentation use

- This dashboard page is suitable for opening a review meeting.
- It provides a quick bridge from market-level indicators to fund-level investigation.
- The KPI cards should be read as summary indicators, with detailed tables used for audit.

Page-level recommendation

- Use this page as the first dashboard screenshot in presentations because it gives the broad market picture.
- Pair it with the fund-performance page when the discussion moves from industry status to scheme selection.
- Avoid making recommendations from this page alone because it is a market overview, not a fund ranking.

Dashboard Screenshots - Fund Performance

The fund performance dashboard organizes scorecard metrics, risk category filtering, fund-house filtering, return-volatility scatter, top funds, and detailed scheme table views.

Figure 11. Dashboard page 2 - Fund Performance and Risk Scorecard.

Fund-performance review points

- Use risk-category slicers before comparing schemes so funds are judged against a relevant risk set.
- Use the scatter plot to identify return-volatility tradeoffs before reading the detailed table.
- Use the top-funds bar chart as an initial shortlist, not as an automatic recommendation.

Decision use

- This page supports fund-screening discussions for moderate and aggressive profiles.
- The scorecard table should be used with risk category filters before comparing schemes.
- The screenshot is static; slicer-based review should be done in the live dashboard when available.

Page-level recommendation

- Use the scorecard to identify candidate funds for deeper review.
- Use the scatter plot to check whether high scores are supported by a reasonable return-volatility tradeoff.
- Use the detailed table when reviewers need exact values behind the visual shortlist.

Dashboard Screenshots - Investor Analytics

The investor analytics page covers state, age group, transaction type, transaction amount by state, city tier, average amount by age group, and transaction-type mix.

Figure 12. Dashboard page 3 - Investor Demographics and Transactions.

Investor-dashboard review points

- Use state and city-tier filters to identify where investor activity is concentrated.
- Use transaction-type mix to distinguish recurring SIP behavior from lumpsum or redemption activity.
- Use age-group views to support segment-level engagement or education planning.

Business use

- This page helps identify where investor education or campaign focus may be strongest.
- Age and transaction views can support targeted SIP messaging.
- State and city-tier filters help translate national insights into regional actions.

Page-level recommendation

- Use this page when discussing customer segmentation or regional expansion.
- Compare SIP participation and transaction value together before prioritizing a geography.
- Keep investor privacy in mind if the dashboard is expanded beyond project sample data.

Dashboard Screenshots - SIP And Market Trends

The SIP and market-trend page links SIP inflow, NIFTY50 close, category filters, year filters, industry folio growth, category inflow heatmap, and category net inflow.

Figure 13. Dashboard page 4 - SIP and Market Trends.

SIP and market review points

- Use SIP inflow and NIFTY50 together to discuss whether participation holds through market movement.
- Use year and category filters to isolate market-cycle effects in specific fund categories.
- Use the category heatmap to locate months or categories with unusually high net inflow.

Monitoring use

- This page is useful for monthly review because it links SIP behavior with market movement.
- Category filters can reveal whether investor flows are rotating between equity, debt, and liquid funds.
- Folio growth alongside SIP inflow provides a stronger participation signal than either metric alone.

Page-level recommendation

- Use this page to monitor whether SIP growth continues during market volatility.
- Add monthly commentary beside the dashboard in future versions to explain sharp changes.
- Keep category-level filters visible because they explain where investor money is moving.

Limitations, Recommendations, And Closing

Limitations

- The transaction layer is a project sample and should not be generalized as the entire Indian mutual fund market.
- Processed NAV is calendar-filled for continuity; trading-day return studies should use source trading days when precision is required.
- Live NAV refresh depends on external network access and should be automated only after API reliability checks.
- Dashboard screenshots are static exports and do not preserve slicer interactivity inside this PDF.

Recommendations

- Use the scorecard as a shortlist generator, then review fund mandate, expense, liquidity, risk appetite, and benchmark fit before final selection.
- Operationalize the pipeline with scheduled NAV refresh, data validation alerts, and versioned output folders.
- Expand historical NAV depth to strengthen 5-year CAGR, drawdown, and rolling risk analysis.
- Publish a cleaned dashboard version for stakeholders with role-based filters and no scroll-dependent visuals in static exports.

Closing statement

The project demonstrates a complete analytics workflow: reliable data preparation, reproducible ETL, clear exploratory analysis, risk-adjusted performance scoring, and dashboard-ready reporting. The output is suitable for review, portfolio discussion, and future automation once the noted limitations are addressed.
